amfori BEPI
Prioritisation Process

How It Works
How It Works. Prioritisation

The process is based on the **Self-Assessment** that is filled out by the producer, through the amfori BEPI Platform.
How It Works. Prioritisation

The completed Self-Assessment provides a detailed listing of the production processes on site, which can then be used to prioritise the main areas of potential impact on the environment.
How It Works. Prioritisation

The prioritisation method used is based on the International Reference Life Cycle Data System (ILCD) and highlights the 4 most relevant environmental areas (EPAs) per production process.

The four shortlisted EPAs are selected together with Environmental Management Systems (mandatory for all producers) and an optional sixth EPA which can be added.
How It Works. Prioritisation

The Self-Assessment also provides a Gap Analysis showing strengths and weaknesses across 11 environmental areas, with a particular focus on the shortlisted areas.
How It Works. Prioritisation

Taken together, the gap analysis and prioritisation process provides you with a shortlist of the most relevant environmental areas per producer and an insight into how these are currently managed, allowing all actors to focus on what is really important.
